Serial No.: 10/728,454
Examiner: Lisa Hashem

The claims:

1. (currently amended) A system attribute exchange method for automatically providing at least one system attribute to one or more Voice-over-Internet Protocol (IP) devices in a network, the method comprising the steps of:
 - (a) automatically sending a Voice-over-IP device identification message from the one or more Voice-over-IP devices to a node when the one or more Voice-over-IP device is operably coupled to the node; ~~and~~
 - (b) automatically responding with a device identification acknowledgment message from the node to the one or more Voice-over-IP devices, the device identification acknowledgment message comprising one or more system attributes; and
 - (c) each of the one or more devices having a physical locality, wherein the system attribute including connectivity information associated with the physical locality of the one or more devices.
2. (previously presented) The system attribute exchange method of claim 1, wherein the device identification acknowledgment is a Voice-over-IP device identification acknowledgment message.
3. (currently amended) The system attribute exchange method of claim 2, wherein the one or more system attributes comprises a Virtual Local Area Network (VLAN) identification assigned to Voice-over-IP communications.
4. (original) The system attribute exchange method of claim 2, wherein the node is a switching device, and the one or more system attributes comprise a switching device identification as well as a port identification of a port to which the Voice-over-IP device is connected.

Serial No.: 10/728,454
Examiner: Lisa Hashem

5. (currently amended) The system attribute exchange method of claim 3, wherein the one or more Voice-over-IP devices comprise one or more Internet Protocol (IP) phones.
6. (original) The system attribute exchange method of claim 3, wherein the Voice-over-IP device is operably coupled to the node at the time of initialization of the Voice-over-IP device.
7. (original) The system attribute exchange method of claim 3, wherein the Voice-over-IP device identification message and the Voice-over-IP device identification acknowledgment are Attribute Advertisement Protocol messages.
8. (original) The system attribute exchange method of claim 7, wherein a destination address of the Voice-over-IP device identification message includes a unique medium access control (MAC) address indicative of a system attribute exchange between the Voice-over-IP device and node.
9. (original) The system attribute exchange method of claim 3, wherein the Voice-over-IP device identification message is sent in response to a node initialization message.
10. (original) The system attribute exchange method of claim 9, wherein the node initialization message is a switching device initialization message transmitted by a switching device upon the initialization thereof.
11. (canceled)
12. (original) The system attribute exchange method of claim 1, wherein the system attribute comprises connectivity information pertaining to physical connection of the one or more Voice-over-IP devices at the node.

Serial No.: 10/728,454
Examiner: Lisa Hashem

13. (currently amended) The system attribute exchange method of claim 12, wherein one or more system attributes are transmitted to a relation database that associates at least one port number to its geographic location, whereby the physical location of the one or more devices is ~~may be~~ determined from the IP address of the Voice-over-IP device.
14. (currently amended) The system attribute exchange method of claim 13, wherein a storage device is included in an Internet Protocol (IP) private branch exchange (PBX) system that cooperates with the Voice-over-IP device to provide voice communications.
15. (original) The system attribute exchange method of claim 1, wherein the node is a switching device.
16. (original) The system attribute exchange method of claim 15, wherein the switching device is adjacent to at least one of the one or more devices.
17. (original) The system attribute exchange method of claim 15, wherein at least one of the one or more devices is a Voice-over-IP device.
18. (original) The system attribute exchange method of claim 17, wherein at least one of the one or more system attributes is a VLAN identification substantially dedicated to Voice-over IP communication within the network.
19. (original) The system attribute exchange method of claim 18, wherein the switching device is made aware of the VLAN identification via a VLAN registration protocol.

Serial No.: 10/728,454
Examiner: Lisa Hashem

20. (currently amended) A system attribute exchange system in a distributed communications network for automatically providing at least one system attribute for purposes of configuring Voice-over-Internet Protocol (IP) communications, the system comprising:
- (a) a Voice-over-IP device adapted to automatically transmit a Voice-over-IP device identification message when said device is operatively coupled to the said network; and
 - (b) a node, operatively coupled to said network, adapted to automatically transmit a Voice-over-IP device identification acknowledgment message to said device, said Voice-over-IP device identification acknowledgment message including one or more system attributes for said Voice-over-IP communications;
 - (c) the at least one of the one or more system attributes including a port identifier of a port at said node to which the Voice-over-IP device is connected; and
 - (d) the port number at which the Voice-over-IP device is communicated to a relational database that associates the physical location of the port with the Internet Protocol (IP) address and extension number of the Voice-over-IP device, whereby the location of a Voice-over-IP device user can be quickly ascertained by emergency response personnel.
21. (currently amended) The system attribute exchange system of claim 20, wherein at least one system attribute includes a Virtual Local Area Network (VLAN) identification for over which Voice-over-IP communications are conducted.
22. (original) The system attribute exchange system of claim 21 wherein the Voice-over-IP device identification message is automatically transmitted when the Voice-over-IP device is operatively coupled to the network.

Serial No.: 10/728,454
Examiner: Lisa Hashem

23. (currently amended) The system attribute exchange system of claim 22 wherein the Voice-over-IP device identification message is automatically transmitted in response to a switching device initialization message sent upon the initialization of the switching device.
24. Canceled
25. Canceled
26. (currently amended) The system attribute exchange system of claim 20 ~~25~~, wherein the system attribute exchange system further includes an Internet Protocol (IP) private branch exchange (PBX) system comprising said relational database.
27. (currently amended) The system attribute exchange method of claim 8, wherein the media access controller (MAC) address is a broadcast MAC address.
28. (original) The system attribute exchange method of claim 8, wherein the MAC address is a multicast MAC address.
29. (currently amended) The system attribute exchange method of claim 19, wherein the VLAN registration protocol is the Group Address Resolution Protocol (GARP) VLAN registration protocol.
30. (currently amended) The system attribute exchange method of claim 12, wherein one or more system attribute are transmitted to a relation database that associates at least one port number to its geographic location, whereby the physical location of the one or more devices ~~is~~ may be determined from the MAC address of the Voice-over-IP device.

Serial No.: 10/728,454
Examiner: Lisa Hashem

31. (original) The system attribute exchange system of claim 24, wherein the port number at which the Voice-over-IP device is communicated to a relational database that associates the physical location of the port with the MAC address and extension number of the Voice-over-IP device, whereby the location of a Voice-over-IP device user can be quickly ascertained by emergency response personnel.

Claims 32-36 (canceled)

37. (original) The system attribute exchange system of claim 21 wherein the Voice-over-IP device identification message is automatically transmitted when the Voice-over-IP device is initialized in the network.
